Announcement

No office hour after class today (was before class)

Previously, given inred $f(x) \in F[x]$, the field F[x]/(f) contains a root θ of f.

Today: adjoin all the roots of f to F.

Recall: $f(a) = 0 \iff x - a \mid f(x)$ and F[x] is a UFD, so f factors into \leq deg f irreducibles, and all factors are unique up to units, so f has \leq n roots.

Def: The exth field k of F is a splitting field for $f(x) \in F[x]$ if

a) f factors into linear factors ("splits (completely") in k[x] (equivalently: k contains n== deg f roots of f, counting multiplicity)

1) If FELFK, F does not split completely in L[x].

E.g. a) $\mathbb{Q}(\sqrt{2})$ is the splitting field for $x^2 - 2 \in \mathbb{Q}[x]$: $x^2 - 2 = (x + \sqrt{2})(x - \sqrt{2})$

R is not (since Q(TE) is smaller)

b) $\mathbb{Q}(\Im z)$ is not the splitting field of $f(x) = x^3 - 2 \in \mathbb{Q}[x]$ Since $\mathbb{Q}(\Im z) \subseteq \mathbb{R}$ but f has two nonreal roots. $f(x) = x^3 - 2 = (x - \Im z)(x^2 + \Im z \times + (\Im z)^2) \in \mathbb{Q}(\Im z)[x]$

irred.

Fix: adjoin a (primitive) root of unity:

Let $g := g_s = e^{2\pi i/3}$ in general, can take g_n to be any nth root of 1 that is not a dth root of 1 for d < n.

Then f(3/2) = f(7 3/2) = f(3/2 3/2) = 0.

Let K = Q(35, 5). Then,

(x)= (x-32)(x-232) € K[x]

So f splits completely over k. If f splits over $L \subseteq k$ then $\Im \mathbb{Z}$, $\Im \Im \mathbb{Z} \in L$, so $\Im \in L$ and k=L.

Thm: Let $f(x) \in F[x]$. \exists a field extension K/F s.t. k is a splitting field for F

Remark: k is unique up to isom., so we will often talk about the splitting field Spf:= Spf of f over F.

Pf: Induction on n:=deg f. Let
$$f_i$$
: irred. factor of f_i

L:= $F[x]/(f_i(x))$. Then f has a root $\Theta_i \in L_i$, so

 $f(x) = (x - \Theta_i)f_2(x) \in L[x]$.

 $deg = n-1$

By induction, there is a splitting field
$$K$$
 for f_2 over L .
$$f(x) = (x - \theta_1)f_2(x) = (x - \theta_1)(x - \theta_2) \cdots (x - \theta_n) \in K[x].$$

Thus, $F(\Theta_1,\Theta_2,...,\Theta_n)$ is a splitting field for f over F.

Cor: If k is a/the splitting field for $f(x) \in F[x]$, then $[x:F] \leq (\deg f)!$

Pf: In duction.

of f

$$[K:F] = [K:F(\Theta)][F(\Theta):F] \leq n!$$

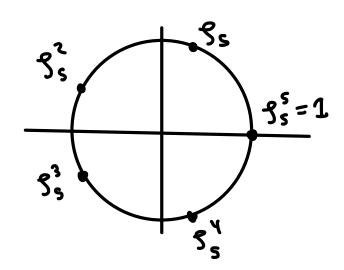

$$\leq (n-i)! \leq n$$
by inductive firmed.)
$$kyp.$$

Remarks:

- a) Most polys. have [k:F] = n!
- b) $n! = |S_n|$. Seems like a random fact, but this will be highly relevant!

Def/Ex: Let 3n be a primitive nth root of 1.

The field Q(3n) is the cyclotomic field of nth roots of 1

and
$$1^{1}2^{N^{1}-1}$$
, $2^{N}_{\nu-1} \in \mathcal{O}(2^{\nu})$

$$= (x-1)(x_{\nu-1} + x_{\nu-5} + \dots + x+7)$$

$$x_{\nu}-1 = (x-1)(x-2^{\nu})(x-2^{\nu}) \cdots (x-2^{\nu}_{\nu-1})$$

So Q(5n) is the splitting field for x n-1

[Q(5n):Q] < n-1 w/ equality iff p: prime (HW3 #4)

Ex:
$$f(x) = x^{p-2} \in \mathbb{R}[x]$$
, p: prime default

unique pos. real pth root of 2

Composite exth:

$$[Q(\mathcal{F}, \mathcal{S}): Q] \leq [Q(\mathcal{F}): Q][Q(\mathcal{S}): Q]$$

Tower Law:

$$P = [Q(UE):Q] | [Q(UE,S_1):Q]$$

$$(P-1) = [Q(S_1):Q] | [Q(UE,S_1):Q]$$

$$(Prince)$$

If time: uniqueness of splitting fields (see D&F Thm 13.8, 13.27)

Thm: Let $\Psi: F \xrightarrow{\sim} F'$ be an isom. of fields.

Let $f(x) \in F(x)$, and f'(x) be the image of f in F'(x) under φ (mapping x to itself)

a) Suppose f is irred. Let α be a root of f, β be a root of f. Then $\exists F(\alpha) \xrightarrow{\sim} F'(\beta)$ sending $F \xrightarrow{\vee} F'(\beta)$ $\alpha \mapsto \beta$

b) Let K be a splitting field for f over F

K be a splitting field for f' over F'

Then 3 K ~> K' sending F +> F'

$$Pf: \alpha) F(\alpha) \approx F[\alpha]_{(f)} \approx F[$$

b) Induction. Choose a root $\alpha \in K$ of some irred. factor P of f and a root $\beta \in K'$ of $p' := \varphi(p)$.

By part a), $F(a) \cong F(\beta)$, so let $E := F(A), E' := F(\beta)$.

Now if $g = \frac{f}{x-x}$, $g' = \frac{f'}{x-\beta}$, we have the same Situation as b) but w/g,g',E,E' replacing f,f',F,F'. By the inductive hypothesis, $\exists K \xrightarrow{\sim} K$ sending $E \xrightarrow{\sim} E'$.

Cor: SPF f is unique up to isom.
